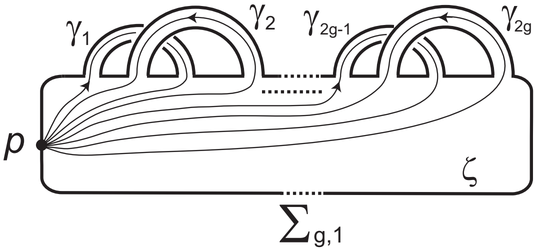
§1. Introduction

- $\Sigma_{g,1} =$  ($g \geq 0$, oriented)

with a standard cell decomposition:



Introduction (2)

Definition (Goussarov, Habiro, Garoufalidis-Levine, Levine)

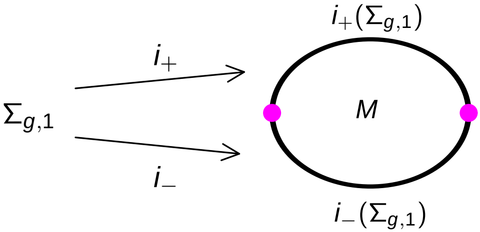
(M, i_+, i_-) : a *homology cylinder* (HC) *over* $\Sigma_{g,1}$

$$\overset{\text{def}}{\Longleftrightarrow} \begin{cases} M : \text{a compact oriented 3-manifold,} \\ i_+, i_- : \Sigma_{g,1} \hookrightarrow \partial M \quad \text{two embeddings} \quad \text{(markings)} \end{cases}$$

satisfying

1. i_+: orientation-preserving, i_-: orientation-reversing;
2. $\partial M = i_+(\Sigma_{g,1}) \cup i_-(\Sigma_{g,1})$,
   $i_+(\Sigma_{g,1}) \cap i_-(\Sigma_{g,1}) = i_+(\partial\Sigma_{g,1}) = i_-(\partial\Sigma_{g,1})$;
3. $i_+|_{\partial\Sigma_{g,1}} = i_-|_{\partial\Sigma_{g,1}}$;
4. $i_+, i_- : H_*(\Sigma_{g,1};\mathbb{Z}) \xrightarrow{\cong} H_*(M;\mathbb{Z})$ isomorphisms.

- (M, i_+, i_-) : a homology cylinder (over $\Sigma_{g,1}$)



Definition

$\mathcal{C}_{g,1} := \{(M, i_+, i_-) : \text{HC over } \Sigma_{g,1}\}/(\text{marking pres. diffeo}).$

Stacking

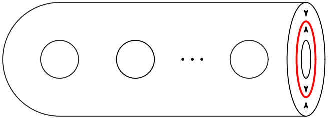
For $(M, i_+, i_-), (N, j_+, j_-) \in \mathcal{C}_{g,1}$,

$$(M, i_+, i_-) \cdot (N, j_+, j_-) := (M \cup_{i_- \circ (j_+)^{-1}} N, i_+, j_-) \quad \in \mathcal{C}_{g,1}$$

$\rightsquigarrow$ $\mathcal{C}_{g,1}$ becomes a monoid.

unit: $(\Sigma_{g,1} \times [0,1], \mathrm{id} \times 1, \mathrm{id} \times 0)$

where corners of $\Sigma_{g,1} \times [0,1]$ are rounded, and



Examples

1. $\mathcal{M}_{g,1}$: the mapping class group of $\Sigma_{g,1}$

   $[\varphi] \in \mathcal{M}_{g,1}$, i.e.

   $\varphi : \Sigma_{g,1} \xrightarrow{\sim} \Sigma_{g,1}$: a diffeo. s.t. $\varphi\big|_{\partial \Sigma_{g,1}} = \mathrm{id}$

   $\Longrightarrow (\Sigma_{g,1} \times I, \mathrm{id} \times 1, \varphi \times 0) \in \mathcal{C}_{g,1}$.

We can check

$\mathcal{M}_{g,1} \hookrightarrow \mathcal{C}_{g,1}$: monoid embedding

$\rightsquigarrow$ $\mathcal{C}_{g,1}$ is an *enlargement* of $\mathcal{M}_{g,1}$.

2. surgery along clovers (Goussarov) or claspers (Habiro)
3. surgery along pure string links (Habegger, Levine)
4. connected sum with a homology 3-sphere X:
$$(\Sigma_{g,1} \times [0,1] \# X, \mathrm{id} \times 1, \mathrm{id} \times 0) \in \mathcal{C}_{g,1}.$$

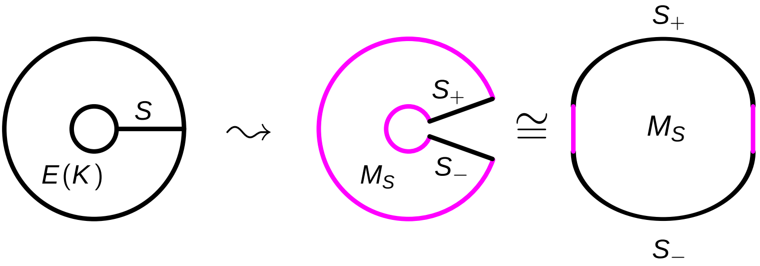
Today we focus on

5. complementary sutured manifolds of Seifert surfaces of a special class of knots.

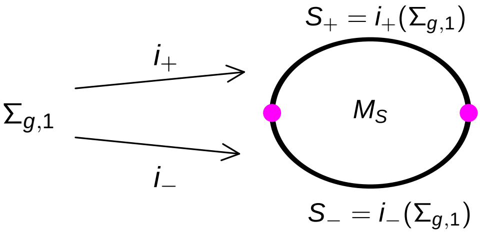
§2. Homological fibered knots

- $K \subset S^3$: a knot,
  S : a Seifert surface of K of genus g.

  M_S : the cobordism obtained from $E(K)$ by cutting along S
  $=$ the (complementary) sutured manifold for S.



- By using any identification $i : \Sigma_{g,1} \xrightarrow{\cong} S$, we obtain a *marked* sutured manifold (M_S, i_+, i_-):



Question When this becomes a homology cylinder?

Homological fibered knots (3)

Proposition (Crowell-Trotter, . . ., Goda-S.)

K : a knot in S^3,

K has a Seifert surface S of genus g s.t. M_S is a homology product (over a copy of S)

$\Longleftrightarrow$ The following hold:

- S is a minimal genus Seifert surface,
- The Alexander polynomial $\Delta_K(t)$ of K is monic,
- $\deg(\Delta_K(t)) = 2\,\text{genus}(K)$.

Homological fibered knots (4)

Definition

A knot K in S^3 is said to be *homologically fibered* if

(1) $\Delta_K(t)$ is monic,

(2) $\deg(\Delta_K(t)) = 2\,\text{genus}(K)$.

Remarks

• (Fibered knots) $\subset$ (HFknots [Homological Fibered knots]) corresponds to $\mathcal{M}_{g,1} \subset \mathcal{C}_{g,1}$.

• We can define *rational* homological fibered knots ($\mathbb{Q}$-HFknot) by assuming only (2).

"Uniqueness"

Proposition

K : an HFknot of genus g

S_1, S_2 : minimal genus Seifert surfaces

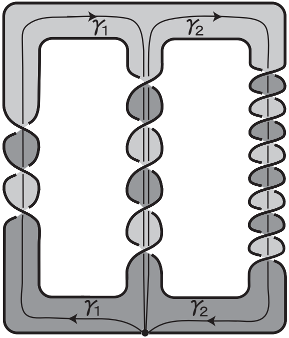
For any markings of ∂M_{S_1} and ∂M_{S_2}, $\exists N \in \mathcal{C}_{g,1}$ s.t.

$$M_{S_1} \cdot N = N \cdot M_{S_2} \quad \in \mathcal{C}_{g,1}$$

In particular, any monoid homomorphism

$$\mathcal{C}_{g,1} \twoheadrightarrow A \qquad \text{w/ } A\text{: an abelian group}$$

gives an invariant of HFknots.



Pretzel knot $P(-3, 5, 9)$ is an HFknot.

<u>Easy to see</u> $P(-2n+1, 2n+1, 2n^2+1)$ is an HFknot.

§3. Factorization formulas of Alexander invariants

Classical case

- $K \subset S^3$: a knot,
  S : a Seifert surface of K w/ a Seifert matrix A.

Assume that A is invertible over $\mathbb{Q}$ (i.e. K is a $\mathbb{Q}$-HFknot).
Then

$$\begin{aligned}\Delta_K(t) &= \det(A^T - tA) \\ &= \det(A^T)\det(I_{2g(S)} - t(A^T)^{-1}A)\end{aligned}$$

What does this *factorization* mean?

We can check:

- A^T and A represent

$$i_+, i_- : \mathbb{Z}^{2g} \cong H_1(\Sigma_{g,1}) \longrightarrow H_1(M_S) \cong \mathbb{Z}^{2g}$$

under certain bases of $H_1(\Sigma_{g,1})$ and $H_1(M_S)$. In fact,

$$\begin{aligned} \det(A) &= \text{The top (bottom) coeff. of } \Delta_K(t) \\ &= \pm|H_1(M, i_+(\Sigma_{g,1})| \\ &= \tau(C_*(M_S, i_+(\Sigma_{g,1}); \mathbb{Q})) \quad \text{torsion} \end{aligned}$$

- $\sigma(M_S) := (A^T)^{-1}A \in Sp(2g, \mathbb{Q})$.
  (Can regard $\sigma(M_S)$ as an H_1-monodromy of M_S.)

So, roughly speaking, our factorization formula says

$$\begin{aligned}\Delta_K(t) &= \det(A^T)\det(I_{2g(S)} - t(A^T)^{-1}A)\\ &= (\text{torsion of } M_S)\cdot(\textit{effect} \text{ of } H_1\text{-monodromy of } M_S).\end{aligned}$$

Remark By Milnor,

$$\frac{\Delta_K(t)}{1-t} = \tau_{\mathbb{Z}}(K),$$

where $\tau_{\mathbb{Z}}(K)$ is the Reidemeister torsion associated with the $\mathbb{Z}$-cover of $E(K)$.

- For an HFknot K,

$$\begin{aligned}\Delta_K(t) &= \det(A^T)\det(I_{2g(S)} - t(A^T)^{-1}A) \\ &= \pm\det(I_{2g(S)} - t(A^T)^{-1}A).\end{aligned}$$

$\rightsquigarrow$ The factorization formula is useless for HFknots!

$\rightsquigarrow$ We will give a generalization by using twisted homology.

Higher-order case (Twisted coefficients)

- K: an HFknot,
- $M_S = (M_S, i_+, i_-) \in \mathcal{C}_{g,1}$: an HC associated with K,
- $\mathcal{K} := \mathrm{Frac}(\mathbb{Z}H_1(M_S)) \cong \mathbb{Q}(t_1, \ldots, t_{2g})$ as twisted coefficients.

Lemma

For $\pm \in \{+, -\}$, $H_*(M_S, i_\pm(\Sigma_{g,1}); \mathcal{K}) = 0$.

cf. classical case: $H_*(M_S, i_\pm(\Sigma_{g,1}); \mathbb{Z}) = 0$.

Definition

- The $\mathcal{K}$-torsion $\tau_{\mathcal{K}}(M_S)$ is
$$\tau_{\mathcal{K}}(M_S) := \tau(C_*(M_S, i_+(\Sigma_{g,1}); \mathcal{K})) \in GL(\mathcal{K})/\sim .$$

- The Magnus matrix $r_{\mathcal{K}}(M_S) \in GL(2g, \mathcal{K})$ is the representation matrix of the right $\mathcal{K}$-isom.:
$$\begin{array}{ccccc} H_1(\Sigma_{g,1}, p; \mathcal{K}) & \xrightarrow[i_-]{\cong} & H_1(M_S, p; \mathcal{K}) & \xrightarrow[i_+^{-1}]{\cong} & H_1(\Sigma_{g,1}, p; \mathcal{K}) \\ \| & & & & \| \\ \mathcal{K}^{2g} & & \xrightarrow[r_{\mathcal{K}}(M_S)\cdot]{\cong} & & \mathcal{K}^{2g} \end{array}$$

Remark By substituting $t_i \mapsto 1$, we have
$$\tau_{\mathcal{K}}(M_S) \mapsto \det A = \pm 1, \qquad r_{\mathcal{K}}(M_S) \mapsto \sigma(M_S).$$

Factorization formulas of Alexander invariants (7)

- If K is fibered w/ the monodromy $\varphi \in \mathcal{M}_{g,1}$, then

$$r_{\mathcal{K}}(M_S) = \overline{\left(\frac{\partial \varphi(\gamma_j)}{\partial \gamma_i}\right)}_{1 \leq i,j \leq 2g}.$$

Theorem (Fibering obstructions)

K, M_S: as before.

If K is fibered, then

1. all the entries of the Magnus matrix $r_{\mathcal{K}}(M_S)$ are Laurent polynomials in $\mathbb{Q}[t_1^{\pm}, \ldots, t_{2g}^{\pm}] \subset \mathcal{K} = \mathbb{Q}(t_1, \ldots, t_{2g})$,
2. the $\mathcal{K}$-torsion $\tau_{\mathcal{K}}(M_S)$ is trivial.

Theorem (Factorization formula)

Let

$$\rho : \pi_1(E(K)) \longrightarrow \frac{\pi_1(E(K))}{\pi_1(E(K))''} \cong H_1(M_S) \rtimes H_1(E(K))$$

be the natural projection, and let $t \in H_1(E(K))$ be a meridian loop. Then we have

$$\tau_{\mathcal{K}(t^{\pm};\sigma)}(E(K)) = \frac{\tau_{\mathcal{K}}(M_S) \cdot (I_{2g} - t \cdot r_{\mathcal{K}}(M_S))}{1-t} \in K_1(\mathcal{K}(t^{\pm};\sigma))/\pm\rho(\pi_1(E(K))),$$

where LHS is the noncommutative higher-order torsion associated with ρ (defined by Cochran, Harvey and Friedl).

§4. 12-crossings non-fibered homological fibered knots

Facts on fibered knots vs. HFknots

- HFknots with at most 11-crossings are all fibered.
- There are 13 non-fibered HFknots with 12-crossings. In particular, Friedl-Kim showed that these 13 knots are not fibered by using twisted Alexander polynomial associated with finite representations.

We computed $r_{\mathcal{K}}(M_S)$ and $\tau_{\mathcal{K}}(M_S)$ for these 13 knots and checked that each of them also detects the non-fiberedness of all 13 HFknots.

12-crossings non-fibered homological fibered knots (2)

Recipe

1. Get all the pictures of those 13 knots.
   [By Computer (Database (KnotInfo) on Internet)]
2. For each of them,
   1. Find a minimal genus Seifert surface S.
      [By hand]
   2. Calculate an admissible presentation of $\pi_1(M_S)$.
      [By hand]
   3. Compute $r_{\mathcal{K}}(M_S)$ and $\tau_{\mathcal{K}}(M_S)$.
      [By hand and also by computer program]

12-crossings non-fibered homological fibered knots (3)

1. List of non-fibered HFknots:

Knot 12n–	Genus	Alexander polynomial
0057	2	$1-2t+3t^2-2t^3+t^4$
0210	3	$1-t-t^2+3t^3-t^4-t^5+t^6$
0214	3	$1-t-t^2+3t^3-t^4-t^5+t^6$
0258	2	$1-4t+5t^2-4t^3+t^4$
0279	2	$1-6t+11t^2-6t^3+t^4$
0382	2	$1-5t+7t^2-5t^3+t^4$
0394	2	$1-6t+11t^2-6t^3+t^4$
0464	2	$1-4t+5t^2-4t^3+t^4$
0483	2	$1-4t+5t^2-4t^3+t^4$
0535	2	$1-7t+11t^2-7t^3+t^4$
0650	2	$1-4t+7t^2-4t^4+t^4$
0801	2	$1-5t+7t^2-5t^3+t^4$
0815	2	$1-2t+t^2-2t^3+t^4$
